

## Milestone 3

Document what features were completed, what worked during the demo, what issues were faced either during the development or during the demo, and what were the suggestions offered by the TA.

**Completed Features:** We completed the login page with login functionality and connected it to a database where usernames and passwords are stored. This means we can verify if a username is valid and if the given password matches what is stored in the database. We also have a working navigation bar that links to several different sites and a logout button that will take the user back to the login page. Our friends page is also functional and has the ability to add friends. However, we are still working on the database to store friends and thus they don't pop up yet in the friends list.

- Login page
- Login form
- Friends page
- Add friends form
- Nav bar and other navigation links

**What Worked:** All the features that we said worked before the demo worked during the demo

**Issues Faced:**

- Splitting up work
- Back-end stuff
- 

**Suggestions from Chelsea:** None. She had no suggestions for us and just told us we were doing good.
